

Review comments

Minor comments:

- Construct the abstract under the following items:
 - Background and objective
 - Methods
 - Results (OR) findings
 - Conclusion
- The attached manuscript is marked in track changes for some spelling and formatting mistakes.
- Revise and correct the reference according to the journal style.

It was mentioned in the abstract that angiotensin II was measured using ELISA technique while in methods it is mentioned that it is measured using EIA. PLEASE REVISE AND CORRECT

Major comment:

- It is supposed to include teen agers (17 ys old) to correlate the effect of angiotensin to hypertension? Older age groups would have been more informative, especially if include hypertensive and normotensive groups to compare angiotensin II level in both groups.
- The height above sea level was not mentioned in the areas studied.
- Comparison between the mean of variables studied should include the pvalue in the table. It seems that there is no statistically significant difference in blood pressure in the three groups
- Discussion is deficient
